in chemistry orbital hybridisation or
hybridization is the concept of mixing atomic
orbitals to form new hybrid orbitals with
different energies shapes etc than the
component atomic orbitals suitable for the
pairing of electrons to form chemical bonds in
valence bond theory for example in a carbon
atom which forms four single bonds the valence
shell s orbital combines with three

covalent or molecular compound properties thoughtco Aug 23 2019 sep 01 2022

properties of covalent compounds most covalent compounds have relatively low melting points and boiling points while the ions in an ionic compound are strongly attracted to each other covalent bonds create molecules that can separate from each other when a lower amount of energy is added to them therefore molecular compounds usually have low melting
